Fight Back Against Ransomware

Protect your data with the most secure NAS on the market

Ransomware is a significant threat to data security. Attackers know that businesses often keep essential data on a NAS, and apps installed on a NAS are frequently exploited by threat actors to access your data.

While most competitors' devices allow third-party apps to be installed, Buffalo NAS run on a **closed system** that prevents third-party apps from being installed, preventing such avenues of attack.

Along with robust security features such as two-factor authentication and snapshots for near-instantaneous data backup and recovery, Buffalo offers **the most secure NAS on the market**.
